APPLICATION BUILDING USING ZIA ASSISTANT

1. Aim

To study the use of the Zia Assistant in Zoho Creator for building an application with natural-language assistance, generating application components, and simplifying the development process with minimal manual coding.

2. Introduction

Zia is the AI assistant built into Zoho's suite of applications. Within Zoho Creator, it can interpret a plain-language description of a business requirement and translate it into concrete application components — forms, fields, and reports — cutting down on the repetitive configuration a developer would otherwise perform by hand.

ZIA ASSISTANT

Rather than adding forms and fields one at a time through the builder, a user can describe the application they need in ordinary language. Zia interprets the description and proposes a matching set of forms and fields. The developer then reviews what has been generated, corrects or extends it where necessary, and takes it forward to testing and deployment

3. Objectives of the Study

- To understand how Zia Assistant supports low-code application development.
- To build an application from a real-world requirement using AI assistance.
- To identify appropriate forms and fields for the chosen application.
- To examine how far Zia can reduce manual, repetitive configuration work.
- To test and refine the AI-generated application before publishing.

4. Application Selected : Student Registration System

A Student Registration System is chosen for this experiment. The application is meant to record new-student registrations, the courses they enroll in, and their admission status, so that the registration office can track applicants from submission through to confirmed enrolment.

5. Procedure:

- Sign in to Zoho Creator
- Create a New Application with Zia
- Describe the Requirement to Zia
- Review the Generated Forms
- Establish Relationships

- Preview and Test the Application
- Save and Deploy

6. Advantages

- Natural-language interaction makes application creation easier to understand.
- Reduces repetitive configuration and manual development work.
- Helps users create application components more quickly.
- Supports rapid prototyping of business applications.
- Generated components can be reviewed and customised by the developer.

7. Limitations

- AI-generated components still require user verification and modification.
- Available Zia capabilities depend on the platform and enabled features.
- Complex application requirements may need additional manual configuration or scripting.

Result:

The experiment was successfully completed by studying application building with Zia Assistant in Zoho Creator. A Student Registration System was selected as the practical application, demonstrating how natural-language requirements can be used to assist in creating forms, reports, and related application components with reduced manual coding.
