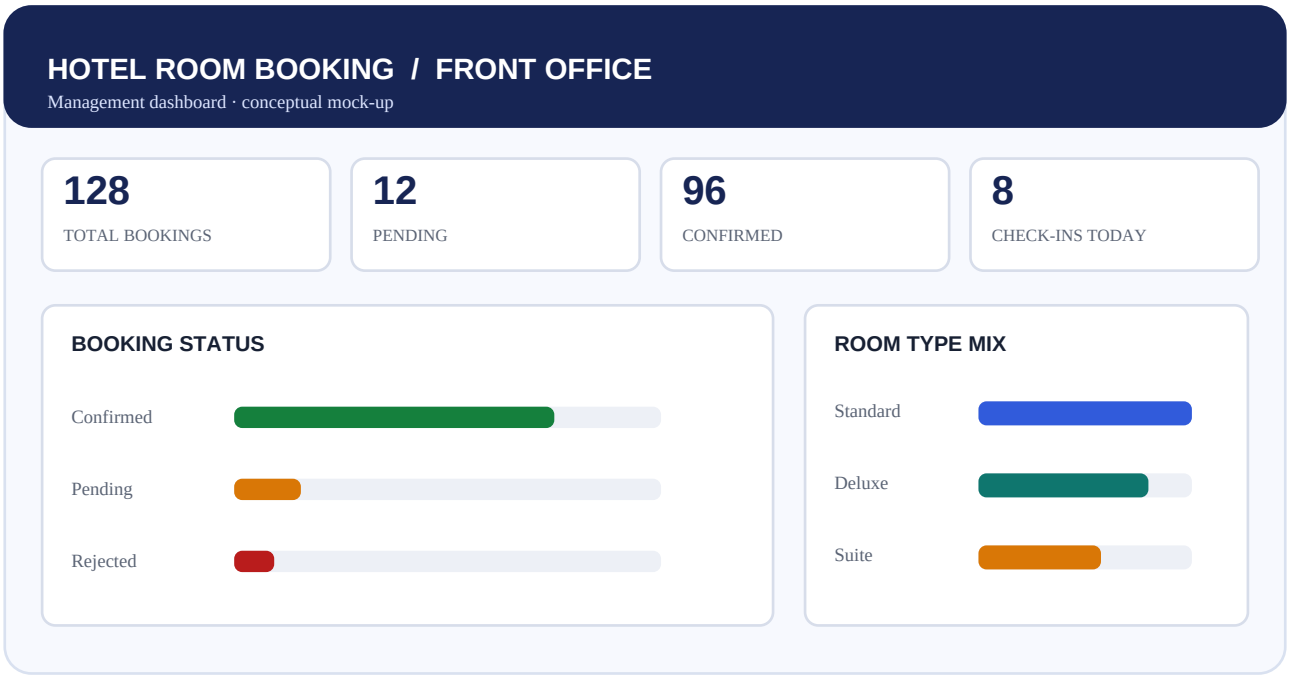
PROJECT / EXPERIMENT REPORT

HOTEL ROOM BOOKING & FRONT OFFICE MANAGEMENT

Zoho Creator Application



STUDENT NAME	ROLL NUMBER
Harshini K P	240701183
PLATFORM	**APPLICATION TYPE**
Zoho Creator	Low-code hotel booking and front-office management

Prepared as a project report with original illustrative visuals based on the application structure described during the conversation. Dashboard values shown in the mock-up are illustrative, not live application data.

1. AIM AND OVERVIEW

Aim: To design a hotel room booking and front-office management application in Zoho Creator that organizes guest details, room allocation, booking status, check-in/check-out dates, meal plans, and staff-facing reports in one place.

Overview: The application is intended to replace scattered manual booking records with structured forms and connected reports. It brings booking entry, room inventory, status tracking, and daily check-in follow-up into a consistent workflow.

2. OBJECTIVES

• Collect guest identity, contact details, guest count, address, room type, and stay dates.

• Maintain room inventory and distinguish available rooms from unavailable rooms.

• Track booking status and support a review/approval path for bookings.

• Provide reports and visual summaries to help staff inspect booking records.

• Schedule check-in reminders and exclude rejected or cancelled bookings from reminder actions.

• Organize the application with a staff-facing dashboard and appropriate access controls.

3. APPLICATION STRUCTURE

The application design described for this report contains the following key forms, reports, and workflow components. Names are preserved from the project context where available.

Component	Purpose
Room_Booking_Form	Primary booking form for guest, room, stay, status, meal plan, and email details.
Room Inventory Form	Stores room inventory and availability information.
Guest Details / Guest_Details Report	Supports viewing guest-related information.
All_Bookings_Report	Provides a consolidated view of booking records.
Booking_Status_Kanban	Displays bookings grouped by their status.
Checkin_Schedule_Calendar	Calendar-style view of check-in dates.
Room Type by Meal Plan Pivot	Summarizes room types against meal plans, subject to Meal_Plan field being configured.
Hotel Management Dashboard	Staff-facing page intended to surface key indicators and embedded reports.
Daily_Checkin_Reminder	Scheduled follow-up for check-in records; email content and execution should be verified in workflow settings.
Room Booking Approval Process	Blueprint intended to guide staff through approval, confirmation, or rejection.

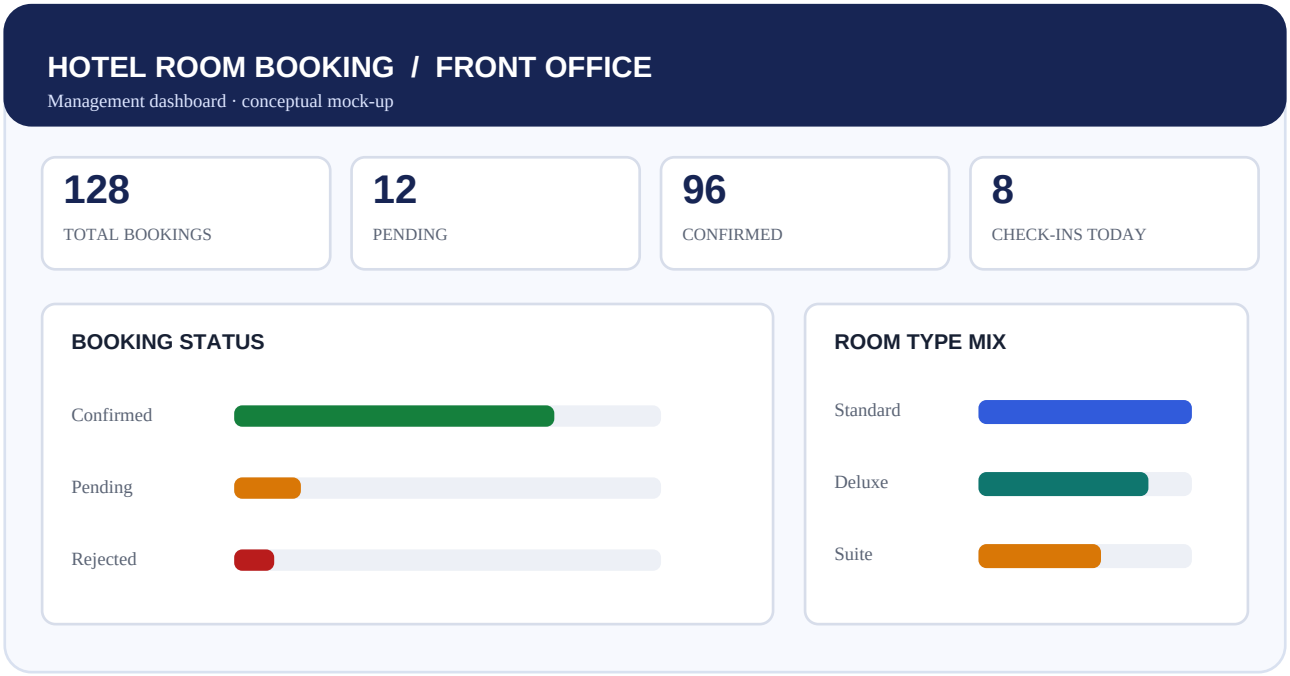
4. ROOM BOOKING FORM — FIELD DESIGN

Field	Purpose / configuration note
guest_name (First Name, Last Name)	Guest's name; both parts are required in the current form setup.
Number_Of_Guests	Number of people included in the booking.
Contact_Number	Guest phone number; import data should match the phone field's expected format.

Field	Purpose / configuration note
Email_Address	Email address used for booking communication and reminders.
Room_Type	Room category such as Standard, Deluxe, or Suite; options must match the configured dropdown.
Permanent_Address	Structured address fields such as address line, city, state, postal code, and country.
Check_In_Date / Check_Out_Date	Arrival and departure dates; ensure check-out is after check-in.
Booking_Status	Status dropdown used to track the booking lifecycle.
Meal_Plan	Optional meal package field; configure the dropdown options before using meal-plan reports.
Additional_Guests_Details	Additional guest information, if needed.

5. DASHBOARD DESIGN

The following original mock-up illustrates a possible dashboard layout for hotel staff. It is a designed visualization, not a screenshot or a live view of the user's Zoho Creator account.

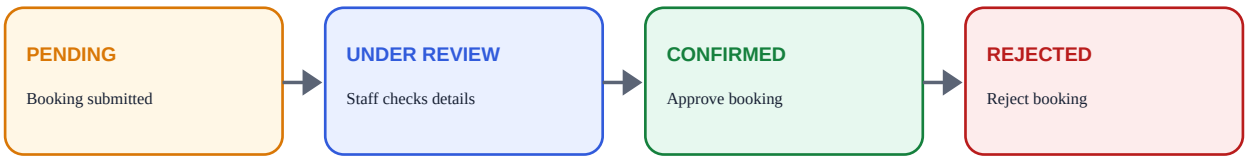


KPI	What it should represent	Suggested source
Total Bookings	Count of booking records	Room_Booking_Form
Pending	Bookings awaiting staff review	Room_Booking_Form filtered by status
Confirmed	Bookings approved for stay	Room_Booking_Form filtered by status
Check-ins Today	Bookings with today's check-in date	Check_In_Date plus status filter

For the live dashboard, bind each KPI and embedded report to actual application data. Do not use the illustrative counts in this report as real booking statistics.

6. BOOKING APPROVAL BLUEPRINT

A blueprint can standardize the steps that staff follow after a booking is submitted. The proposed path is shown below; actual transition names and status values should match the blueprint configured in Zoho Creator.



Illustrative process diagram; verify actual Blueprint transitions in the live app.

Stage / action	Expected behavior
Pending Approval	New or submitted booking waits for staff review.

Stage / action	Expected behavior
Approve Booking	Authorized staff confirms the booking and updates Booking_Status to the configured confirmed value.
Reject Booking	Staff rejects the booking and updates Booking_Status to Rejected.
Final verification	Test both transitions with sample records and confirm that the status field changes as expected.

7. DAILY CHECK-IN REMINDER

The described schedule is named **Daily_Checkin_Reminder** and is intended to run at 08:00 AM in the Asia/Kolkata time zone. The stated criteria relate to the Check_In_Date field, with rejected or cancelled bookings excluded.

Recommended verification checklist:

• Confirm whether the schedule is configured for the intended date offset (for example, on the check-in date or one day before); the exact timing must match the requirement.

• Open the schedule's action configuration and inspect the Send Mail action.

• Set the recipient to the guest's Email_Address field using the field picker rather than typing a literal placeholder.

• Add a clear subject, for example: “Your hotel check-in reminder”.

• Add message content with the guest name, check-in date, room type, and a contact/help note using supported inserted fields.

• Verify the criteria excludes Booking_Status values of Rejected and Cancelled, using the exact dropdown values in the app.

• Test using a sample booking and confirm that the intended recipient and inserted values are correct before relying on the schedule.

Suggested email content

Subject: Your hotel check-in reminder

Message:
Hello [Guest Name],

This is a reminder about your upcoming stay. Your check-in date is [Check-In Date], and your selected room type is [Room Type]. Please keep your booking details ready when you arrive.

We look forward to welcoming you.
Hotel Front Office Team

8. REPORTS AND DATA VISUALIZATION

Report	Use
All_Bookings_Report	Review booking records in a consolidated list.
Booking_Status_Kanban	Visually group bookings by status.
Checkin_Schedule_Calendar	Inspect check-in dates on a calendar.
Bookings_Spreadsheet	Review or export booking data in a tabular format.
Room Type Popularity Chart	Compare booking volume across room types.
Room Type by Meal Plan Pivot	Compare room categories and meal packages; requires the Meal_Plan field.
Guest_Details Report	Review guest-related details.
Cancellation_Management Report	Inspect cancellation-related records.
Payment_Management Report	Track payment-related data if payment fields are configured.

Report	Use
Housekeeping_Management Report / Maintenance_Management Report	Support housekeeping and maintenance tracking if corresponding forms and fields are configured.

9. BULK DATA IMPORT

Bulk import is useful when multiple booking records must be added without entering each record manually. Prepare a spreadsheet whose columns match the form fields and map each column carefully in the import wizard.

Important import checks:

• For a composite name field, map the spreadsheet's First Name and Last Name columns to the corresponding subfields, not both to the same parent field.

• Format Contact_Number consistently with the configured phone field; if Zoho validates the value as a phone number, use a valid number format and review any country-code requirements.

• Use dropdown values exactly as configured in Room_Type, Booking_Status, and Meal_Plan.

• Use an unambiguous date format accepted by the import wizard and check that Check_Out_Date is later than Check_In_Date.

• Map each address component to the matching subfield of Permanent_Address.

• Resolve every warning shown in the column-mapping panel before completing the import.

10. USER ACCESS AND PORTAL CONSIDERATIONS

The project can separate internal hotel-staff access from guest-facing access. A portal should be created only after the target application is available in the portal configuration list and the required access rules are defined.

Suggested access model:

Role	Suggested access
Administrator	Configure forms, reports, workflows, user permissions, and application settings.
Front Office Staff	Create and update bookings, review guest details, and manage check-in/check-out information.
Manager	View consolidated reports, review booking status, and monitor operational indicators.
Guest / Portal User	If a guest portal is implemented, allow only the guest's permitted booking actions and records.

These are recommended role definitions, not confirmation that these exact roles or portal permissions are already enabled in the live app.

11. TESTING PLAN

Test case	Expected outcome
Submit a booking with valid required fields	Record saves with the expected guest, room, and date details.
Leave a required field blank	Form validation identifies the missing required value.
Approve a pending booking	Status updates to the configured confirmed value.
Reject a pending booking	Status updates to Rejected.
Import multiple valid records	Rows are imported and mapped to the correct fields.
Import invalid phone/date/dropdown values	Warnings are identified and corrected before final import.
Run reminder against eligible booking	Email action uses the configured recipient and message fields.
Run reminder against rejected/cancelled booking	Record is skipped by the configured criteria.

Test case	Expected outcome
Open dashboard and reports	Reports display data from the correct source forms.

12. RESULT

A structured design for a Hotel Room Booking & Front Office Management application has been documented, covering the primary booking form, inventory, reports, dashboard concept, approval flow, reminder workflow, bulk import, and access model.

13. CONCLUSION

Zoho Creator can bring hotel booking information and front-office tasks into one low-code application. The form-and-report structure supports organized data entry and review, while a tested blueprint and reminder workflow can reduce repetitive staff work. Before production use or academic submission, validate the live configuration, run sample records through the workflows, and replace any illustrative settings with verified application details.

APPENDIX: ORIGINAL VISUALS INCLUDED

This report includes custom-generated dashboard and workflow diagrams to explain the proposed design. These are original illustrations, not captured screenshots from the Zoho Creator account. Actual record counts, role permissions, email delivery, and saved workflow states should be verified in the live application.
