DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

LAB ASSIGNMENT REPORT

Hotel Room Booking & Front Office Management Application

Submitted by	HARSHINI K P
Roll Number	240701183
Application	Hotel Room Booking & Front Office Management
Platform	Zoho Creator (Low-Code Application Builder)
Primary Form	Room_Booking_Form
Report	Room_Booking_Form_Report and related booking reports

Submitted in partial fulfilment of the requirements for the laboratory assignment.

1. Objective

To design and configure a hotel room booking application in Zoho Creator that collects guest and stay details, validates booking information, and helps front-office staff monitor reservations through reports, workflows, and a centralized management view.

2. Problem Statement

Managing hotel reservations through calls, messages, and separate registers can lead to incomplete guest information, booking conflicts, and missed check-in reminders. The application provides a structured form and connected reports so staff can review booking details, update status, and prepare for arrivals more consistently.

3. Application Overview

Component	Description
Room_Booking_Form	Captures guest name, number of guests, contact number, address, room type, check-in/check-out dates, booking status, meal plan, and email address.
Room_Booking_Form_Report	Displays submitted booking records for review and management.
Bookings_Spreadsheet	Provides a grid-style view for browsing and supported bulk updates.
Booking_Status_Kanban	Groups booking records by status for visual tracking.
Checkin_Schedule_Calendar	Shows booking dates in a calendar-style view.
RoomType_Popularity_Chart	Summarizes booking counts by room type when the required data is available.
Hotel Management Dashboard	Brings key navigation links, indicators, and embedded reports into one staff workspace.

4. Form Fields and Data Validation

The main booking form uses required fields to ensure essential booking information is collected. The Name field is configured with separate First Name and Last Name subfields, so both values must be mapped when importing spreadsheet data. Contact numbers should be imported in the format accepted by the configured phone field; if Zoho flags a number, verify the country code and phone-field validation settings before importing.

Key fields include:

Field	Purpose	Required / Notes
guest_name (First Name + Last Name)	Identifies the guest	Both subfields required
Number_Of_Guests	Number of people staying	Numeric value
Contact_Number	Guest contact details	Use valid phone format
Room_Type	Requested room category	Use configured dropdown options
Permanent_Address	Guest address	Map address subfields to the matching columns
Check_In_Date / Check_Out_Date	Stay duration	Use Zoho's accepted date format
Booking_Status	Tracks reservation state	Must match dropdown choices
Meal_Plan	Meal preference	Must match configured dropdown choices
Email_Address	Guest email for communication	Use valid email format

5. Reports and Data Presentation

The application uses multiple report views to present the same booking data for different operational needs. A list report supports quick review; a spreadsheet view helps staff inspect records in a grid; a Kanban report highlights status; a calendar organizes arrivals by date; and chart or pivot reports can summarize room preferences when the underlying fields are populated correctly.

For the RoomType_By_MealPlan_Pivot report, the intended configuration is Room_Type as rows, Meal_Plan as columns, and booking count as the value. The source form must contain a Meal_Plan field with values matching the configured choices for this report to be meaningful.

6. Workflow and Automation

A booking approval blueprint was configured with Pending Approval, Confirmed, and Rejected stages. The Approve Booking and Reject Booking transitions are intended to update Booking_Status, supporting a clearer approval process.

The Daily_Checkin_Reminder schedule is configured to run at 08:00 AM (Asia/Kolkata) and target bookings around the check-in date. The workflow is intended to skip bookings marked Rejected or Cancelled. The email action should be tested with a valid guest email and a sample booking to confirm the recipient, subject, message content, and schedule timing.

7. Importing Booking Records in Bulk

To import multiple bookings without entering each record manually, prepare an Excel or CSV sheet with one row per booking and column headers that correspond to the form fields. During column mapping, map First Name and Last Name to the matching subfields of guest_name; do not map a combined full name to both. Map each address component to the matching Permanent_Address subfield. Validate phone numbers, date formats, dropdown values, and mandatory fields before confirming the import.

8. Testing and Verification

Test	Expected result
Submit a booking with all mandatory fields	Record is accepted and appears in the booking report
Leave a required field empty	Form validation prevents incomplete submission
Import multiple rows	Rows are mapped to the correct form fields without duplicate or missing values
Change booking status using the blueprint	Status reflects the selected transition
Review calendar and chart reports	Records appear according to the configured date and category fields
Run a reminder test	Email action is sent only to eligible bookings and uses correct content

9. Outcome

The project brings guest booking information, operational reports, status tracking, and scheduled reminders into one Zoho Creator application. The structure is designed to reduce repeated manual entry and help hotel staff review booking information more efficiently. Final validation depends on confirming the live form configuration, imported data, and workflow email action in Zoho Creator.

10. Conclusion

The Hotel Room Booking & Front Office Management application demonstrates how a low-code platform can support structured data collection and day-to-day reservation operations. The combination of forms, reports, a dashboard, an approval blueprint, and a scheduled reminder provides a foundation that can be tested and extended as the hotel's requirements evolve.
